Logistics

- Office hours Thursdays at 16:00-17:00 in my office (see Blackboard)
- Exercise 1 will be posted later this week
 - Find other group members on Discourse if possible
 - ▶ If no partner by next Wednesday, email Guillermina
 - ▶ Remember to check out 'Learning R' page on Blackboard before starting project if possible

January 16, 2023 1

Today:

- More on rejection sampling
 - Weighted resampling
 - Adaptive rejection sampling
- Monte Carlo Integration
- Importance sampling

Lecture 4: Review

What have we done until now?

- Simulation from discrete probability models
 - ► General Algorithm
 - ► Some special algorithms for specific distribution
- Simulation from continuous probability models
 - ► Inversion Sampling
 - ► Use known relationships between RV
 - ► Change of variables
 - ► Ratio of uniform methods
 - Mixtures
 - Multivariate distribution
 - ► Rejection Sampling

January 16, 2023 2

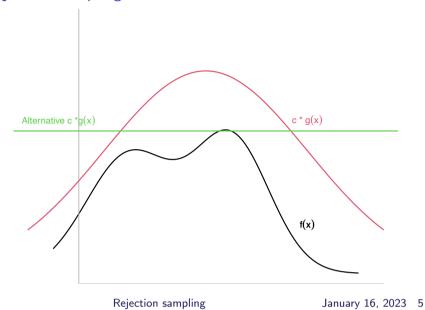

Rejection sampling

- We want $x \sim f(x)$ (target density).
- We know how to generate realisations from a density g(x)
- We know a value c>1, so that $\frac{f(x)}{g(x)}\leq c$ for all x where f(x) > 0.

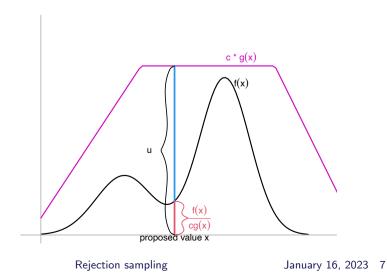

Algorithm:

```
finished = 0
while (finished = 0)
   generate x \sim g(x)
   compute \alpha = \frac{1}{c} \cdot \frac{f(x)}{g(x)}
    generate u \sim U[0,1]
   if u \le \alpha set finished = 1
return x
```

Rejection sampling

Rejection sampling

Rejection sampling

• The overall acceptance probability for the algorithm is

$$P(U \le \frac{1}{c} \cdot \frac{g(X)}{f(X)}) = \int_{-\infty}^{\infty} \frac{f(x)}{c \cdot g(x)} g(x) dx = \int_{-\infty}^{\infty} \frac{f(x)}{c} dx = c^{-1}.$$

- The expected number of trials up to the first success is *c*
- The smaller c the more efficient the algorithm

Rejection sampling

January 16, 2023 6

Example I: Sample from N(0,1) with rejection sampling

• Target distribution:

$$f(x) = \frac{1}{\sqrt{2\pi}} \exp\left(-\frac{x^2}{2}\right).$$

• Proposal distribution:

$$g(x) = \frac{\lambda}{2} \exp(-\lambda |x|), \lambda > 0$$

Rejection sampling

Example I: Sample from N(0,1) with rejection sampling

• Find bound c:

$$\frac{f(x)}{g(x)} = \frac{\frac{1}{\sqrt{2\pi}} \exp(-1/2x^2)}{\frac{\lambda}{2} \exp(-\lambda|x|)} \le \sqrt{\frac{2}{\pi}} \lambda^{-1} \exp\left(\frac{1}{2}\lambda^2\right) \equiv c(\lambda)$$

• We choose λ such that c is as small as possible

$$c(\lambda) \stackrel{\lambda=1}{=} \sqrt{rac{2}{\pi}} \exp\left(rac{1}{2}
ight) pprox 1.3$$

• Then the acceptance probability is:

$$\alpha(\lambda) \stackrel{\lambda=1}{=} \exp\{-\frac{1}{2}x^2 + |x| - \frac{1}{2}\}$$

Rejection sampling

January 16, 2023 9

Standard Cauchy: Rejection sampling algorithm

Example II: Standard Cauchy

Remember: Using ratio-of-uniforms method we can simulate from standard Cauchy as:

- Sample (x_1, x_2) uniformly from the semi-unit circle
- Compute $y = \frac{x_2}{x_1}$
- y is a sample from the uniform Cauchy

How can we sample from the semi-unit circle?

Rejection sampling also works when x is a vector.

Rejection sampling

January 16, 2023 10

Standard Cauchy: Summary

Note: To do this algorithm we do not need to know the value of the normalising constant area(C_f).

This is always true in rejection sampling.

Rejection sampling January 16, 2023 11 Rejection sampling January 16, 2023 12

Rejection sampling - Acceptance probability

Note: For c to be small, g(x) must be similar to f(x). The art of rejection sampling is to find a g(x) that is similar to f(x) and which we know how to sample from.

Issues: c is generally large in high-dimensional spaces, and since the overall acceptance rate is 1/c, many samples will get rejected.

Rejection sampling

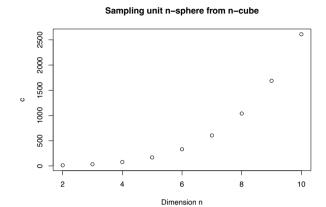

January 16, 2023 13

Rejection Sampling

Difficulties when implementing rejection sampling:

- ullet Finding the constant c o Weighted resampling
- Finding the proposal density $g(x) o ext{Adaptive rejection}$ sampling

Sampling uniformly from the unit *n*-dimensional sphere

Rejection sampling

January 16, 2023 14

Weighted resampling

A problem when using rejection sampling is to find a legal value for c. An approximation to rejection sampling is the following:

Let, as before:

• f(x): target distribution

• g(x): proposal distribution

Rejection sampling January 16, 2023 15 Rejection sampling January 16, 2023 16

Algorithm

- Generate $x_1, \ldots, x_n \sim g(x)$ iid
- Compute weights

$$w_i = \frac{\frac{f(x_i)}{g(x_i)}}{\sum_{j=1}^n \frac{f(x_j)}{g(x_j)}}$$

• Generate a second sample of size m from the discrete distribution on $\{x_1, \ldots, x_n\}$ with probabilities w_1, \ldots, w_n .

The resulting sample $\{y_1, \ldots, y_m\}$ has approximate distribution f(x)

Rejection sampling

January 16, 2023 17

Comments

- The advantage is that we do not need the constant c
- The resulting sample has approximate distribution f
- The resample can be drawn with or without replacement provided that n >> m, a suggestion is n/m = 20.
- The normalising constant is not needed.
- This approximate algorithm is sometimes called sampling importance resampling (SIR) algorithm.
- g should have tails at least as heavy as f!

Weighted resampling

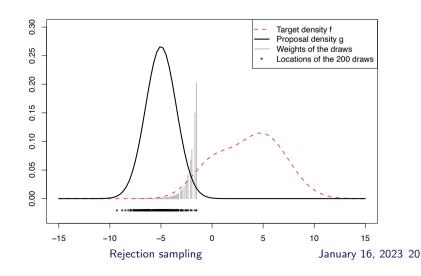

For illustration see Lecture4.R

Rejection sampling

January 16, 2023 18

Illustration

A bad choice of g will result in a bad representation of f

Adaptive rejection sampling

Remember:

Algorithm:

```
\begin{aligned} & \text{finished} = 0 \\ & \text{while (finished} = 0) \\ & \text{generate } x \sim g(x) \\ & \text{compute } \alpha = \frac{1}{c} \cdot \frac{f(x)}{g(x)} \\ & \text{generate } u \sim U[0,1] \\ & \text{if } u \leq \alpha \text{ set finished} = 1 \\ & \text{return } x \end{aligned}
```

- Note that the algorithm is valid even if g(x) is different in every iteration
- How to find g(x)?

Rejection sampling

January 16, 2023 21

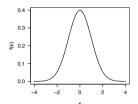

Adaptive rejection sampling (2)

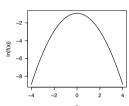

Basic idea: Start with a proposal distribution $g_0(x)$ (with $c=c_0$). If we propose a value from $g_0(x)$ and reject it, then we use it to construct an improved proposal $g_1(x)$ with $c_1 \leq c_0$. Continue untill acceptance

Adaptive rejection sampling

This method works only for log concave densities, i.e.

$$(\ln f)''(x) \le 0$$
, for all x .

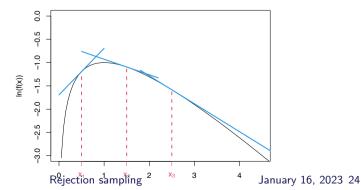

Many densities are log-concave, e.g. the normal, the gamma (a > 1), densities arising in GLMs with canonical link.

Rejection sampling

January 16, 2023 22

Adaptive rejection sampling (2)

- Start with an initial grid of points $x_1, x_2, ..., x_m$ (with at least one x_i on each side of the maximum of $\ln(f(x))$) and construct the envelope using the tangents at $\ln(f(x_i))$, i = 1, ..., m.
- Draw a sample from the envelop function and if accepted the process is terminated. Otherwise, use it to refine the grid.

Monte Carlo integration

Assume we are interested in

$$\mu = \mathsf{E}[h(X)]; \ X \sim f(X)$$

If X is continuous and scalar we have

$$\mu = \mathsf{E}[h(X)] = \int_{-\infty}^{\infty} h(x)f(x) \ dx$$

Analytical solution is the best when possible!

Monte Carlo Integration

January 16, 2023 25

Monte Carlo integration (II)

 $\hat{\mu}$ is an unbiased estimate of μ

- $\mathsf{E}(\hat{\mu}) = \mu$
- $\widehat{\text{Var}}(\hat{\mu}) = \frac{1}{N(N-1)} \sum_{i=1}^{N} (h(x_i) \hat{\mu})^2$
- Then the strong law of large numbers says:

$$\hat{\mathsf{E}}(h(x)) = \frac{1}{N} \sum_{i=1}^{N} h(x_i) \overset{a.s}{\to} \int h(x) f(x) dx = \mathsf{E}(h(x))$$

Monte Carlo integration

Assumption

It is *easy* to generate independent samples x_1, \ldots, x_N from a distribution f(x) of interest.

A Monte Carlo estimate of

$$\mu = \mathsf{E}(h(x)) = \int h(x)f(x)dx$$

is then given by

$$\hat{\mu} = \frac{1}{N} \sum_{i=1}^{N} h(x_i).$$

What is the mean and variance of this estimator?

Monte Carlo Integration

January 16, 2023 26

Monte Carlo integration (III)

Monte carlo integration can be used for any function $h(\cdot)$

Examples

- Using $h(x) = x^2$ we obtain an estimate for $E(x^2)$.
- An estimate for the variance follows as

$$\widehat{\mathsf{Var}}(x) = \hat{\mathsf{E}}(x^2) - \hat{\mathsf{E}}(x)^2$$

• Setting $h(x) = I(x \in A)$ we get:

$$E[h(x)] = E[I(x \in A)] = P(x \in A)$$

Importance sampling

One of the principal reasons for wishing to sample from complicated probability distributions f(z) is to be able to evaluate expectations with respect to some function p(z):

$$\mathsf{E}(p) = \int p(z)f(z)dz$$

The technique of importance sampling provides a framework for approximating expectations directly but does not itself provide a mechanism for drawing samples from a distribution.

Monte Carlo Integration

January 16, 2023 29

Importance sampling

Let $x_1,\ldots,n_N\sim g(x)$ then the importance sampling estimator of $\mu=\mathsf{E}_f(h(x))$ is given by

$$\hat{\mu}_{IS} = \frac{1}{N} \sum_{i=1}^{N} \frac{h(x_i)f(x_i)}{g(x_i)} = \frac{1}{N} \sum_{i=1}^{N} h(x_i)w(x_i)$$

wih

- We need g(x) > 0 where h(x)f(x) > 0
- The quantities $w(x_i) = \frac{f(x_i)}{g(x_i)}$ are called importance weights
- $\mathsf{E}(\hat{\mu}_{\mathsf{IS}}) = \mu$
- $Var(\hat{\mu}_{IS}) = \frac{1}{N} Var_g[\frac{h(x)f(x)}{g(x)}]$

Importance sampling: Idea

[See blackboard]

Monte Carlo Integration

January 16, 2023 30

Importance sampling estimators

To compute the importance sampling estimator

$$\hat{\mu}_{IS} = \frac{1}{N} \sum_{i=1}^{N} h(x_i) w(x_i)$$

we need to know the normalizing constant of f and g. When this is not possible an alternative is a "self-normalizing" importance sampling estimator

$$\tilde{\mu}_{IS} = \frac{\sum h(x_i)w(x_i)}{\sum w(x_i)}$$

where we need that

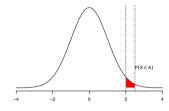

$$g(x) > 0$$
 where $f(x) > 0$

Importance sampling: Example

Assume we want to estimate

$$P(X \in [2, 2.5])$$
 where $X \sim \mathcal{N}(0, 1)$

- $\hbox{ \ } \hbox{ \ } \hbox{ \ Can use MC estimate} \rightarrow \\ \hbox{ \ } \hbox{ small efficiency}$
- Importance sampling can help "focus" the sampler in the correct area
 Show code

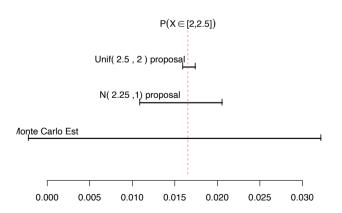

Monte Carlo Integration

January 16, 2023 33

Importance sampling: Example

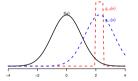

Nsamples = 1000

Importance sampling: Example

$$\mu = P(X \in [2, 2.5]) = \int_{\mathcal{R}} I(x \in [2, 2.5]) f(x) dx$$
 with $f(x) = \mathcal{N}(0, 1)$
Three estimation schemes:

- 1. MC estimate
- 2. IS with proposal $g_1(x) = \mathcal{N}(2.25, 1)$
- 3. IS with proposal $g_2(x) = \mathcal{U}(2, 2.5)$

Note: in case 3) we cannot use the self-normalizing version of the IS algorithm

Monte Carlo Integration

January 16, 2023 34

Importance sampling

We are interested in

$$\mu = E_f(h(x)) = \int h(x)f(x)dx$$

- If possible compute it analytically!
- If we can sample from f(x) we can use Monte Carlo integration
- Possible alternative: Importance sampling
 - ightharpoonup sample from auxiliary distribution g(x) and re-weight
 - ▶ no need to reject samples, throwing out information
 - ▶ can be used as variance-reduction technique

Monte Carlo Integration

Monte Carlo Integration January 16, 2023 35

January 16, 2023 36

Importance sampling Algorithm

Let $x_1, \ldots, x_n \sim g(x)$, and let $w(x_i) = \frac{f(x_i)}{g(x_i)}$, $i = 1, \ldots, n$ then

$$\hat{\mu}_{IS} = \frac{\sum h(x_i)w(x_i)}{n}$$

$$\tilde{\mu}_{IS} = \frac{\sum h(x_i)w(x_i)}{\sum w(x_i)}$$

- Unbiased
- Consistent
- Need to know the normalizing constant

- Biased for finite *n*
- Consistent
- Self-normalizing

Monte Carlo Integration

January 16, 2023 37

Importance sampling: Summary

As with rejection sampling, the success of importance sampling depends crucially on how well the proposal distribution g(x) matches the target distribution f(x).

Monte Carlo Integration

January 16, 2023 38
